

Brainstorming & Idea Prioritization

Ideation Phase

Date	28-09-2026
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	4 Marks

1. Problem Background

In many organizations, requests for network services such as VPN access, firewall rule changes, IP address allocation, port opening, connectivity troubleshooting and configuration changes still arrive through emails, phone calls and manually raised tickets. With no single entry point, requests reach the network team with missing details, wait in approval queues and trigger repeated follow-ups, while requesters have little idea where their request stands.

This individual project explores how ServiceNow can bring the complete network request lifecycle onto one platform. The **Service Catalog** captures each request through a structured form, and **Flow Designer** automates routing, approvals, task creation, notifications and tracking.

Step 1: Problem Identification and Selection

#	Observed problem	Effect on the process
1	Requests arrive through many channels (email, calls, manual tickets)	Requests are scattered and easy to miss
2	Important technical details are missing from submissions	Repeated clarification with the requester
3	Approvals are routed by hand	Delays before work can even begin
4	Network administrators assign tasks manually	Engineering time lost to admin work
5	Requesters cannot see the current status	Constant follow-up calls and emails
6	Urgent requests are not clearly prioritized	Critical needs wait in the normal queue
7	Completed changes are hard to trace	Weak audit trail and inconsistent records

Selected Problem Statement

How can ServiceNow automate network service requests so that submission, validation, approval, assignment, tracking and closure become faster, more consistent and more transparent?

Identified User Needs

Requesters	Approvers and Network Team
• Simple way to submit a network request • Guided collection of mandatory technical details • Clear, up-to-date request status • Automatic notifications • Complete request history	• Automatic categorization of requests • Correct approval routing • Automatic assignment to the network team • Visible priority and urgency • Reliable audit record

Step 2: Brainstorming, Idea Listing and Grouping

Ideas for the ServiceNow solution were generated independently and then grouped by the stage of the request lifecycle they support.

Lifecycle stage	Ideas brainstormed
Submit	• Dedicated Network Request catalog item • Options for VPN, Firewall, IP, Port and Connectivity requests • Dynamic form that shows fields based on request type • Mandatory technical fields for validation
Classify and Approve	• Set priority automatically from request information • Route to the appropriate approver automatically • Fast-track path for high-priority requests
Fulfil	• Flow Designer to automate the whole request lifecycle • Create and assign fulfilment tasks to the Network team
Communicate and Track	• Notifications on every status change • Requester self-service progress tracking • Escalation alerts as target completion time approaches
Govern and Report	• Approval and fulfilment audit history • Dashboard of open, pending and completed requests • Reports on request volume and processing time

Step 3: Idea Prioritization

Each idea was scored on two criteria: **Importance** (business and user impact) and **Feasibility** (ease of implementation in ServiceNow).

Rank	Idea	Importance	Feasibility	Priority
1	Network Service Catalog	High	High	Critical
2	Automated approval routing	High	High	Critical
3	Automatic task assignment	High	High	Critical
4	Dynamic request form	High	Medium	High
5	Automatic notifications	Medium	High	High
6	Request status tracking	High	High	High
7	SLA escalation	High	Medium	High
8	Network dashboard	Medium	Medium	Medium
9	Advanced analytics	Medium	Medium	Medium
10	Urgent request pathway	Medium	Medium	Medium

Prioritization Matrix (numbers refer to the rank above)

	High feasibility	Medium feasibility
High importance	Do first 1 Catalog, 2 Approval routing, 3 Task assignment, 6 Status tracking	Plan carefully 4 Dynamic form, 7 SLA escalation
Medium importance	Quick win 5 Automatic notifications	Add later 8 Dashboard, 9 Advanced analytics, 10 Urgent pathway

Step 4: Selected Idea

Automated Network Request Management in ServiceNow was selected as the final idea. It combines self-service submission, automated approvals, task creation, notifications and workflow automation in one solution, directly removing the delays and manual effort of traditional network request handling. The first release will focus on the top-ranked ideas:

- Network Request catalog item with a dynamic, validated form
- Flow Designer automation for approval routing and task assignment
- Status tracking and automatic notifications for requesters
