

Define the Problem Statement

Ideation Phase

Date	28-09-2026
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	2 Marks

1. Problem Statement

Organizations often handle network service requests such as new network connections, device-related requests, connectivity requirements, VPN access, firewall changes, IP allocation and port opening through manual or disconnected processes: email threads, phone calls and spreadsheets. As a result, requests suffer from delays, incorrect routing, approval bottlenecks, repetitive work, incomplete information and very limited visibility of their status.

2. Proposed Direction

Automated Network Request Management in ServiceNow provides one centralized, self-service channel for submitting network requests and automates everything that follows. The **Service Catalog** collects structured requests; automated routing and approvals move them to the right people; tasks are created for the network team; and status tracking with notifications keeps everyone informed.

3. Problem Framing

Question	Answer
Who is affected?	Requesters (employees and project teams), approvers and network administrators
What is the problem?	Network requests are raised, approved and fulfilled through manual, disconnected steps
Where does it happen?	Across email, calls, spreadsheets and separate tickets, with no single system of record
When is it felt most?	At every request, and most painfully for urgent ones when approvals stall
Why does it matter?	Slower delivery, wasted IT effort, frustrated users and a weak audit trail

4. Key Problems Identified

#	Problem	What happens	Result
1	Manual request processing	Each request needs several hand-offs: reading mails, raising tickets, updating records	Longer processing time and more effort
2	Approval delays	Approvers are contacted by hand and responses are not tracked	Requests stall waiting for authorization
3	Incorrect or delayed routing	Without workflow rules a request may reach the wrong team or person	Rework and slow fulfilment
4	Lack of transparency	Neither requesters nor IT teams can see the current stage of a request	Frequent status-chasing
5	Incomplete request information	Technical details such as IP range, ports or source and destination are missing	Repeated communication and delayed work

5. How Might We

- How might we let users submit any network request from a single, guided form?
- How might we make sure every request carries the technical details the network team needs?
- How might we route approvals and tasks automatically to the right people?
- How might we keep requesters informed without them having to ask?

6. Current Process vs Proposed Solution

Aspect	Current (manual)	Proposed (ServiceNow)
Submission	Email, calls and spreadsheets	Service Catalog item with a guided form
Validation	Missing details found late	Mandatory fields checked at submission
Approval	Chased manually	Flow Designer routes to the correct approver
Assignment	Admin sorts and assigns by hand	Tasks created and assigned to the Network team
Visibility	Requester asks IT for updates	Live status tracking with notifications

Problem Statement Summary

Automated Network Request Management in ServiceNow replaces manual, scattered request handling with a centralized and automated workflow. It streamlines submission, validation, approval, routing, tracking and notifications, reducing delays and manual effort while improving transparency and efficiency.
