

Customer Journey Map

Automated Network Request Management in ServiceNow

Date	27-08-2026
Project Name	Automated Network Request Management in ServiceNow

This map follows one employee through the full experience of raising and tracking a network service request. It shows what the user does, which touchpoints they use, how they feel, where the friction is and what the ServiceNow solution improves at each stage.

Scenario: Meera, a project team member, needs a firewall port opened for a new application. She wants it approved and completed without sending emails or chasing the network team.

Journey at a Glance

Emotional curve: how the requester's confidence changes across the journey

The two lowest points are stage 1 (not knowing whom to approach) and stage 3 (waiting for approval). These are the moments the solution focuses on through a single self-service entry point and automated approval routing.

Stage-by-Stage Detail

Stage 1: Need Identification	
Actions	The employee realizes a network service is needed, such as a new connection, VPN access, a firewall change or a port opening.
Touchpoints	Team chat and email, colleague discussions, past experience
Feelings	Uncertain about whom to contact
Pain points	Not sure whom to approach; no standard process to follow
Opportunities	Promote the self-service portal; publish clear catalog item descriptions
Outcome	Need is recognized and the right channel is known

Stage 2: Request Submission	
Actions	Logs in to the ServiceNow portal, opens the Network Request catalog item, fills in the form and submits it.
Touchpoints	ServiceNow portal, Service Catalog form, UI policies
Feelings	Confident, because the form is simple and guided
Pain points	Several forms or emails; unclear mandatory information
Opportunities	Dynamic form with conditional fields, inline help text and validation
Outcome	A complete request is submitted quickly and accurately

Stage 3: Validation and Approval	
Actions	The workflow checks the inputs and routes the request to the approver using predefined rules. The approver approves or rejects.
Touchpoints	Approval workflow, approval notifications, approver workspace
Feelings	Hopeful that approval comes without delay
Pain points	Delayed approvals; unclear approval status
Opportunities	Rule-based approver selection; reminders and escalation for pending approvals
Outcome	Request is approved or rejected according to policy

Stage 4: Request Fulfilment	
Actions	An approved request creates a network record and a task for the Network team, who fulfil it manually or through automation tools.
Touchpoints	Network team workspace, tasks and records, automation scripts (optional)
Feelings	Relieved that the request is being worked on
Pain points	Manual assignment delays; wrong assignment; no progress visibility
Opportunities	Automatic assignment; integration with network automation tools
Outcome	Request is fulfilled efficiently by the right team

Stage 5: Notification and Updates	
Actions	The requester and stakeholders receive email or portal notifications on approval, work in progress and completion.
Touchpoints	Email, portal, mobile notifications
Feelings	Satisfied with regular updates
Pain points	Updates arrive late; requester has to follow up
Opportunities	Real-time notifications at each stage; status page; SLA tracking
Outcome	Users stay informed without asking

Stage 6: Request Closure	
Actions	The request is marked complete and closed. The requester can confirm the result and give feedback.
Touchpoints	Portal, closure notification, optional feedback form
Feelings	Happy that the request is completed successfully
Pain points	No closure confirmation; no feedback collected
Opportunities	Automatic closure rules; short feedback survey
Outcome	Request is closed with high satisfaction

Moments That Matter

Moment	Risk if left manual	Solution response
Choosing where to raise the request	Requests scatter across email, chat and calls	One Network Request catalog item on the portal
Waiting for approval	Approvals stall and nobody notices	Automated routing with reminders and escalation
Waiting for the network team	Task assigned late or to the wrong person	Automatic task creation and assignment
Knowing the outcome	Requester keeps following up	Notifications at every stage and closure confirmation

Overall value: The journey moves from self-service submission, to automated processing and approval, to fulfilment, notification and closure. Together these improve speed, accuracy, transparency and user satisfaction while reducing manual effort for IT teams.
