

Data Flow Diagram and User Stories

Project Design Phase II

Date	27-08-2026
Project Name	Automated Network Request Management in ServiceNow

1. Data Flow Diagram

The diagram shows how data moves through the Automated Network Request Management system in ServiceNow, from submission by the requester through approval, record creation, fulfilment, notification and closure. Processes are in the centre, data stores on the left and external entities on the right.

Main flow: Requester → Submit Network Request → Validate and Route for Approval → Create Network Record / Task → Fulfil Request → Send Notifications and Close Request

Data Stores

ID	Data store	ServiceNow table	What it holds
D1	Service Catalog	Catalog item and variables	The Network Request item and the variables used to collect details
D2	Request Record	u_network_request	Every submitted network request and its approval state
D3	Network Records	u_network_db	Network records and fulfilment tasks created after approval
D4	Notification Log	sys_email	Emails and in-app notifications sent to users and teams

Flow Designer Actions Behind Each Process

Process	Flow Designer action	Purpose
P1 Submit Network Request	Get Catalog Variables	Read the values the user entered in the catalog form
P2 Validate and Route for Approval	Create Record, Ask for Approval	Create the request record and send it to the approver
P3 Create Network Record / Task	Flow Logic, Create Record	Branch on the approval outcome and create the network record or task
P4 Fulfil Request	Update Record	Reflect the technician's progress on the request
P5 Send Notifications and Close Request	Send Email, Update Record	Inform users and mark the request closed

The workflow includes approval handling and can optionally integrate with network automation tools.

2. User Stories

ID	Role	User story	Acceptance criterion	Priority
US01	Employee	As an employee, I want to submit a network request through a self-service portal so that I can ask for network services without emails or calls.	The Network Request catalog item opens and submits successfully	High
US02	Employee	As an employee, I want to fill in a structured request form so that the network team has every detail it needs.	Mandatory variables are enforced; conditional fields appear as expected	High
US03	System	As the system, I want to validate each request and route it for approval so that it reaches the right approver.	A request record and an approval task are created after submission	High
US04	Approver	As an approver, I want to approve or reject requests so that only authorized requests are processed.	The decision sets the request to Approved or Rejected	High
US05	System	As the system, I want to create network records and tasks after approval so that IT can start work without manual set-up.	A network record exists only for approved requests	Medium
US06	Network Technician	As a network technician, I want to see my assigned tasks and update their progress so that requests are fulfilled efficiently.	Task status can be changed and the update shows on the request	High
US07	Employee	As an employee, I want to track my request in real time so that I never need to follow up.	The current request state is visible on the portal	High
US08	System	As the system, I want to send notifications at key stages so that users and IT teams stay informed.	Emails are generated on submission, decision and completion	Medium
US09	IT Manager	As an IT manager, I want reports and analytics on requests so that I can monitor workload, resolution time and SLA performance.	A report shows request counts by type and status	Medium

Design goal: Give users a seamless, transparent and automated experience for raising, approving, fulfilling and tracking network requests, while removing repetitive manual work for IT teams.
