

Solution Requirements

Requirement Analysis

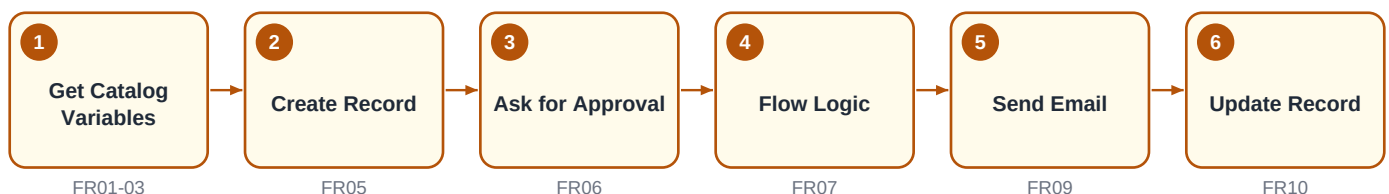

Date	27-08-2026
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	4 Marks

The solution needs a centralized, automated platform for submitting, processing, approving, fulfilling and tracking network-related service requests. The requirements below follow the project objective: reduce manual processing, improve request visibility, and automate approvals, task assignment and notifications.

1. Functional Requirements

ID	Requirement	Description	Priority	Traces to
FR01	Request submission	Users can submit network-related requests through the ServiceNow Service Catalog.	Must	US01, UAT-01, 03
FR02	Structured request form	The form captures connection type, device type, address, device details and other relevant information.	Must	US02, UAT-02
FR03	Requester information	The form captures the requester's name, email ID and phone number.	Must	US02, UAT-02
FR04	Conditional fields	Fields appear or hide based on selections, for example an extra field when device type is "Others".	Should	US02, UAT-05
FR05	Request record creation	A network request record is created automatically once the catalog request is submitted.	Must	US03, UAT-04
FR06	Approval management	Applicable requests are sent for approval, and approve or reject decisions are recorded.	Must	US04, UAT-06, 07
FR07	Task and record assignment	Approved requests generate the network records or tasks needed for fulfilment.	Must	US05, UAT-04
FR08	Request fulfilment	The network team can process the request and update it as work progresses.	Must	US06, UAT-09
FR09	Notifications	Email notifications go to the relevant users or teams at key stages of the lifecycle.	Should	US08, UAT-08
FR10	Record updates	The workflow updates the request record to match processing and approval status.	Must	US07, UAT-10, 12

Flow Designer sequence that delivers these requirements

2. Non-Functional Requirements

ID	Requirement	Description	How it is verified
NFR01	Usability	The request form is simple and friendly to use when submitting network requests.	Users complete a request without help during UAT
NFR02	Automation	Manual activity is minimized by automating routing, approvals, record creation and notifications.	Flow runs from submission to update with no manual step
NFR03	Reliability	Requests are processed consistently under the configured workflow and approval rules.	End-to-end UAT scenario passes repeatedly
NFR04	Transparency	Users and IT teams can see request status and processing progress.	Status is visible on the record and in notifications
NFR05	Efficiency	Processing delays and repetitive IT workload are reduced.	Processing time compared with the manual process
NFR06	Scalability	The solution supports more request types and additional variables as needs grow.	A new variable is added without redesigning the flow
NFR07	Maintainability	Catalog items, variables, UI policies, tables and workflows can be configured inside ServiceNow.	Changes made through configuration only

3. Technology Requirements

Component	Purpose in the solution
ServiceNow platform	Hosts the entire solution
Service Catalog	Entry point for submitting network requests
Catalog variables	Collect the request information from the user
Catalog UI policies	Drive dynamic form behavior such as conditional fields
ServiceNow tables	Store request and network information
Flow Designer	Automates the workflow from submission to update
Approval mechanism	Authorizes or rejects requests
Email notifications	Communicate request status to users and teams
Reporting and analytics	Monitor request volume, resolution time and SLA adherence

Requirement Summary

The solution must deliver an end-to-end automated network request process: capture accurate information, route requests for approval, create the necessary records and tasks, support fulfilment, update request status and keep users informed. This supports the project goal of faster processing, better transparency and less manual effort.
