

Problem-Solution Fit

Project Design Phase

Date	27-08-2026
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	4 Marks

1. Fit at a Glance

The project puts automated notifications, task assignment, approval processes and workflow automation at the centre of request fulfilment.

2. Who Has the Problem

Stakeholder	Problem faced today	How the solution fits
Requester (employee)	Submits by email or call, gets no status, follows up repeatedly	Guided catalog form, live status and automatic notifications
Approver	Approval requests arrive by hand and are easy to overlook	Approval task routed automatically with a clear approve / reject action
Network / IT team	Sorts requests, chases missing details and assigns work manually	Complete, validated requests with tasks created automatically
IT manager	No consolidated view of volume, delays or SLA performance	Reports and analytics on request volume, resolution time and SLA

3. Problem-to-Solution Mapping

Problem	Solution feature	Resulting benefit
Information collected manually and incompletely	Catalog variables with dynamic UI policies	Complete requests on the first attempt
Requests routed by hand	Flow Designer with rule-based routing	Requests reach the right person automatically
Approvals are slow and untracked	Ask for Approval action	Faster, recorded decisions
Records created by re-keying data	Create Record action	Consistent records without duplicate entry
Users are not kept informed	Send Email notifications	Timely updates at every stage
No visibility of progress	Status tracking, reports and analytics	Transparent progress and SLA monitoring

4. Fit Validation

Check	Assessment
Is the problem real?	Yes. VPN, firewall, IP and port requests are routinely raised and today depend on emails, calls and manual tickets.
Does the solution address the cause?	Yes. It replaces scattered manual steps with a single automated workflow.
Is it feasible?	Yes. It uses standard ServiceNow capabilities: Service Catalog, UI policies, Flow Designer, approvals, email and reporting.
Will users adopt it?	Likely. One self-service portal with a guided form replaces several channels.
Can success be measured?	Yes: processing time, approval turnaround, number of follow-ups and SLA adherence.

5. How Fit Will Be Measured

Measure	Manual process	With ServiceNow solution
Processing time	Long and variable	Shorter and predictable
Approval turnaround	Depends on manual chasing	Automated routing with tracked decisions
Follow-up requests	Frequent	Reduced by status tracking and notifications
Data quality	Details often missing	Mandatory fields enforced at submission

Value Proposition

A standardized, automated network request process that improves processing speed, approval efficiency, transparency and communication, while reducing repetitive manual work for IT teams.
