

Proposed Solution

Project Design Phase

Date	27-08-2026
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	2 Marks

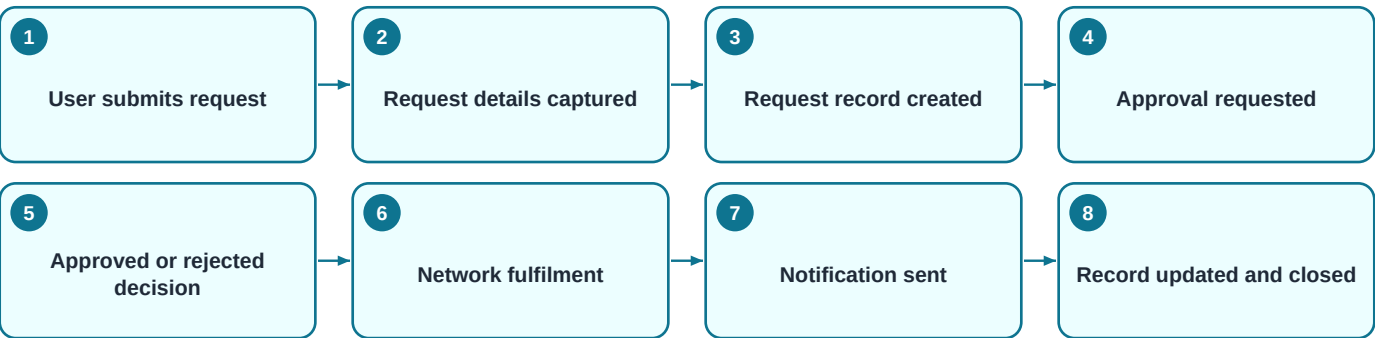

1. Solution Overview

The proposal is an **Automated Network Request Management System** in ServiceNow that simplifies and automates the full lifecycle of network-related service requests. Users submit requests through a self-service Service Catalog using structured forms. An automated Flow Designer workflow then captures the variables, creates the network record, starts the approval, applies approval-based logic, sends notifications and updates the request record.

2. Key Components

Component	Role in the solution
Service Catalog	Offers the Network Request catalog item to users
Catalog variables	Capture connection type, device type, address and device information
Catalog UI policies	Show or hide fields dynamically based on the user's selections
Flow Designer	Automates the request-processing workflow end to end
Approval workflow	Routes each request for an approve or reject decision
Network database	Stores the generated network request records
Notifications	Keep users and relevant teams informed about progress
Reporting and analytics	Track request volume, resolution time and SLA adherence

3. Proposed Solution Flow

If the approver rejects a request, the record is updated to Rejected and the requester is notified, so the process ends cleanly without any fulfilment work.

4. Solution Overview Table

Section	Description
Problem	Manual network request handling causes delays, approval bottlenecks, repetitive work and poor visibility of request status.
Idea / solution	A ServiceNow-based system that automates submission, approvals, record creation, notifications and fulfilment.
Novelty	Brings the Service Catalog, dynamic forms, automated approvals, Flow Designer, notifications and tracking together in one workflow.
Customer satisfaction and impact	Easier submission, faster processing, clearer status, timely updates and a lighter workload for IT teams.
Business model	An enterprise ServiceNow implementation and automation solution whose value comes from shorter processing time and lower operating cost.
Scalability	Extends with more catalog items, workflows, reports, network automation integrations and other IT service requests.

5. Scope

In scope	Optional extension
• Network Request catalog item with dynamic form • Automated approval and rejection handling • Network record creation and task assignment • Email notifications and status updates • Reports on volume, resolution time and SLA	• Integration with network automation tools for standard requests • Additional catalog items for other IT services • Extra dashboards and analytics

Expected outcome: Faster processing, reduced manual effort, improved transparency and better control over network service requests.
