

Solution Architecture

Project Design Phase

Date	27-08-2026
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	4 Marks

1. Layered Architecture

The solution is built as nine layers on the ServiceNow platform. A request enters at the user layer, is captured through the catalog and form layers, automated by the workflow and approval layers, stored in the data layer, communicated through notifications, completed by the fulfilment team and reported on.

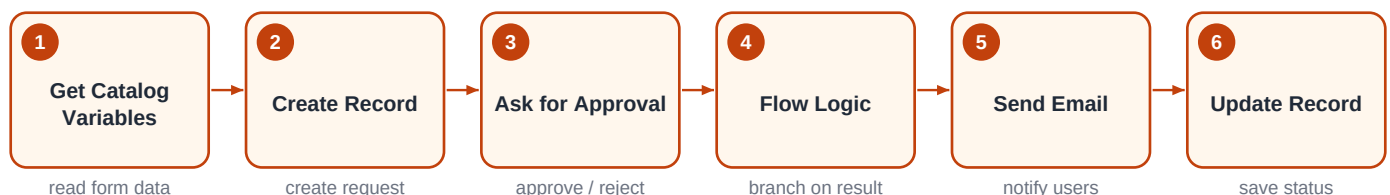

Arrows show the order in which a request moves through the layers.

2. Layer Details

Layer	Component	Function
User	Requester, Approver, IT / Network team	Submit, review, approve and process network requests
Application service	ServiceNow Service Catalog	Provides the Network Request catalog item
Form	Catalog variables and UI policies	Capture request details and show fields dynamically
Workflow	Flow Designer	Automates request processing and approval
Approval	Ask for Approval	Handles approval or rejection of requests
Data	Network database table	Stores network request information and status
Notification	Email notifications	Send request status and approval updates
Fulfilment	Network / IT team	Process approved requests
Reporting	Reports and analytics	Monitor request volume, resolution time and SLA performance

3. Workflow Actions in Flow Designer

The Flow Logic step handles the approval outcome: approved requests continue to fulfilment, rejected requests are updated and closed with a notification.

4. Request Path Through the Architecture

#	Step
1	The requester opens the Network Request item in the Service Catalog.
2	Catalog variables and UI policies collect and validate the details.
3	Flow Designer reads the variables and creates the network request record.
4	Ask for Approval sends the request to the approver, who approves or rejects.
5	The record in the network database table is updated with the decision.
6	An email notification informs the requester and the network team.
7	The network / IT team fulfils approved requests and updates progress.
8	The record is updated and the request is closed.
9	Reports and analytics show volume, resolution time and SLA adherence.

5. Architecture Decisions

Decision	Reason
Build on ServiceNow Flow Designer	Low-code automation keeps the workflow easy to change and maintain
Use catalog variables and UI policies	Guided, dynamic forms improve data quality at submission
Store requests in one network table	A single record keeps history, status and reporting consistent
Send notifications by email	Keeps requesters and teams informed without them having to ask
